ABSTRACT

The Statewide Assessment Program of the Florida State Department of Education is responsible for measuring student achievement and disseminating the assessment results. One dimension of this effort has been the development of predicted or adjusted school scores. These scores are based on several factors which are related to achievement. Among these achievement factors, also known as predictor variables, are Spanish native language, family income level, white collar occupation, college education and minority enrollment. The predictor variables used in calculating the 1975-76 scores were collected on a school basis and are expressed as percentages for the school. The district averages listed on the tables are weighted averages based on the population of each school. Predicted test scores were calculated for each school participating in the 1975-76 assessment of communication skills and mathematics in grades 3 and 6. This document contains the predicted test scores for all schools and districts, as well as the observed scores. A glossary of major terms is appended. (Author/MV)

FLORIDA STATEWIDE ASSESSMENT PROGRAM

School Predicted Scores

1975-76

STATISTICAL REPORT
Division of Public Schools' MIS

Series 77-07
February 1977

The 1975-76 Listing of School Predicted Scores contains summary test scores for all third and fifth grade schools which participated in the 1975-76 Statewide Assessment of communication skills (reading and writing) and mathematics. Requests for additional copies or further information should be sent to:

Student Assessment Section
Florida Department of Education
Tallahassee, Florida 32304

PREFACE

The Statewide Assessment Program of the Department of Education is responsible for measuring student achievement and disseminating the assessment results. One dimension of this effort has been the development of "predicted" or "adjusted" school scores. These scores are based on several factors (primarily socio-economic) which are related to achievement.

Using accepted statistical techniques, Statewide Assessment Program staff calculated predicted test scores for each school participating in the 1975-76 assessment of communication skills and mathematics in grades 3 and 6. This document contains the predicted test scores for all schools and districts.

The Department of Education believes the predicted score will be a valuable tool for examining school achievement. Your comments and reactions will be appreciated. They may be directed to:

Student Assessment Section
Department of Education
Tallahassee, Florida 32304

ERRATA: The predictor labels "White Collar Occ." and "Family Income" appear in incorrect order in this report. The labels should be reversed. Also, you will notice within the tables the symbol "**". This means 100%.

CHAPTER I

INTRODUCTION

The Florida Statewide Assessment Program was created by the Educational Accountability Act of 1971, which mandated the establishment of statewide objectives and the development of a statewide system of assessment to determine the degree to which Florida students have achieved the objectives. The law further required that the results for each school, district, and the state be made public.

Since 1971-72, the Statewide Assessment Program has measured student achievement in the basic skill areas of reading, writing, and mathematics. The 1975-76 assessment of reading, writing, and mathematics involved all of Florida's third and sixth graders, approximately 110,000 students per grade. The assessment measured the skills identified in the 1975-76 statewide objectives for communication skills (reading and writing) and mathematics. The 1975-76 objectives were virtually identical to the 1974-75 objectives, which had been developed by the Department of Education through a process which involved review both by state-level task forces and by committees of teachers, curriculum specialists, administrators, and parents in each district.

Test items measuring the statewide objectives were written by Florida district and university educators. The items were reviewed by state-level task forces and field-tested prior to use.

The assessment was conducted in October of 1975, a major change from the previous practice of assessing in February. The time of testing was changed in order to provide test results earlier in the school year.

Detailed objective-related results for each student, school, and district were distributed to all schools and districts during the winter of 1976. These reports have been valuable in identifying specific educational needs, but have been less useful for drawing overall conclusions about the achievement.

To meet this need, the Assessment Program has developed a new method of reporting school scores which provides a standard of comparison in addition to the state mean. This method attempts to "predict" or "adjust" a school's score by considering the effect of non-school factors which are related to achievement, such as the socio-economic characteristics of the students in the school.

Predicted scores were first reported for all schools which participated in the 1974-75 assessment of communication skills and mathematics in grades 3, 6, and 9. The method was used again in 1975-76 for all schools involved in the assessment of communication skills and mathematics in grades 3 and 6.

This document, 1975-76 Listing of School Predicted Scores, contains the 1975-76 predicted and actual scores for all schools and districts. A brief explanation of how the scores were developed is presented on pages 3 - 4. A detailed definition of major terms (marked with an asterisk) is in Appendix A. The tables of school and district scores begin on page 8.

CHAPTER II

CALCULATING TEST SCORES

The objective-referenced reports of assessment results show the percentage of students who can do specific things, such as add two fractions, use commas correctly, or read a story and tell what happened. This kind of information is helpful in identifying areas of curriculum which need revision, both within a specific school or district and throughout the state.

Summary test scores supplement the objective-referenced data. They are useful in analyzing overall school performance and identifying schools in need of improvement in their approach to basic skills. The summary scores provided by Statewide Assessment for communication skills, mathematics, and total test allow a school to determine its relative educational need in two ways: (1) by comparing its scores to state averages, and (2) by comparing its scores to "predicted scores" which take into account the unique characteristics of the students the school serves.

Comparisons between school and state scores can identify schools in which children are well above the state average in their achievement of basic skills, as well as those in which children are below the state average. However, they do not present a complete picture of school achievement because they fail to consider the characteristics of the children in the school. For example, relatively high test scores are usually found in schools which have families with high income and educational levels. Likewise, lower test scores are usually associated with schools which have an income level lower than the state.

Predicted scores take into account the characteristics of the children in the school and compare the school's average to the achievement of other schools with similar students. Thus, the school with high income and educational levels is compared to other high income schools, rather than solely to the state average. The statistical technique used to make the comparisons is called multiple regression.

Observed Scores

The school's test scores (called *observed scores**) represent the average number of test items answered correctly for communication skills, mathematics, and the total test. School observed scores range from a high of about 81 to a low of about 16. The state score for each subject area is 50. About 67% of the schools in the state have scores between 40 and 60, and 95% have scores between 30 and 70.

---

*See also Appendix A.

The following kinds of comparisons can be made between the various school scores and the state average.

1. If the school score is higher than the state score of 50, the school is performing above the state average in that area. If it is lower than 50, the school is achieving below the state average.

2. If the school score is higher in mathematics than in communication skills, the school is performing relatively better in mathematics. Likewise, if the score for third grade mathematics is higher than for sixth grade mathematics, it means that third graders performed relatively better on the assessment than did sixth graders.

Predicted Scores

The school predicted score is based on characteristics of the student body (also referred to as *predictor variables**) which correlate highly with school test scores. The five variables which were used in the calculation of the 1975-76 predicted scores are:

1. Spanish native language
2. Family income
3. White collar occupation
4. College education
5. Minority enrollment

These same predictor variables were used in calculating the 1974-75 predicted scores.

The basic assumption in calculating predicted scores is that a school with student characteristics like the state's would be expected to score at the state average and that, as a school's characteristics differ from the state's, its test scores will change correspondingly. For example, if a school has families with high income and educational levels, its "predicted" test scores would be relatively high.

The predicted scores are presented as a *predicted range**, such as 41-64. If the school's observed test score is within the predicted range, the school is performing as expected. For example, if the school's score for mathematics is 55 and its predicted range is 41-64, the school is within its predicted range. Most schools in the state are performing within their predicted ranges.

If the school's test score is higher than the predicted range, the school is performing better than predicted and can be considered a *positive outlier**. If the school's test score is lower than the predicted range, the school is performing lower than predicted and can be considered a *negative outlier**.

The results provide an indication of a school's relative effectiveness in dealing with its unique student body. A school which has higher achievement than other schools with similar student characteristics will appear as a

---

*See Appendix A.

positive outlier in the assessment. A school which is lower than other similar schools will appear as a negative outlier. The Department of Education is conducting studies of the outlier schools to see if it is possible to identify any instructional practices which are causing exceptionally high (or low) student achievement.

Considerations in Interpreting Predicted Scores

There are certain limitations which must be considered in the interpretation of assessment results. The 1975-76 assessment did not measure all goals of education. Only basic skills in reading, writing, and mathematics were included. Within these basic skills, only a portion of them could be tested in the available time. Thus, conclusions should be limited to these subjects and skills rather than to the entire curriculum.

Further, the testing, conducted in October, measured entering skills for third and sixth graders--in other words, skills taught in preceding grades. Consequently, scores are reflective of a school's achievement only if students received their second or fifth grade instruction there.

Additional limitations apply to the interpretation of predicted scores. First, the scores show relative performance. The fact that a school's observed score is higher than the state score of 50 or than its own predicted range does not mean that all students in the school have acquired the basic skills. It simply means that the school has a higher average achievement rate than the state or than other similar schools. Each school still has a responsibility to help all students acquire basic skills. The objective-referenced assessment reports indicate that there is room for improvement in all schools.

Second, the identification of schools as positive or negative outliers is not a sure selection of the most or least effective schools in the state. Some of the predictor variables are estimates, so it is possible that an occasional predicted range is in error. (However, the amount of error is not enough to move a school from the positive outlier area to the negative outlier category.) Much further investigation must be conducted to determine whether the schools identified statistically as outliers are really unique.

Third, the predicted scores cannot be used to measure improvement from one year to the next, such as comparing a school's 1974-75 third grade scores to their 1975-76 scores. The statistical process assumes that the state average is always 50, so the predicted and observed scores will not reflect any increase in the percentage of students who achieve basic skills.

CHAPTER III

TABLES OF SCHOOL AND DISTRICT DATA

The tables, which begin on the next page, contain the predicted ranges and observed scores for all schools and districts in the state. The layout for each subject area is identical to the example for third grade mathematics shown below.

	MATHEMATICS		
Schools	Pred. Range	Obs. Score	Outlier
1111 Puddleville Elem.	30-56	51	
2222 Cloudburst Elem.	43-70	54	
3333 Rainbow Elem.	41-68	42	
4444 Cloudy Skies Elem.	31-58	60	+
5555 Rain Drops Elem.	31-58	37	
District Averages	36-62	49	

The *Predicted Range** is given first, followed by the *Observed Score**. If the observed score is higher than the range, a "+" appears in the *Outlier** column. If the school's observed score is below its predicted range, a "-" appears in the outlier column. In the example, Puddleville Elementary has a predicted range of 30-56 and its observed score of 51 is within the predicted range, so there is no mark in the outlier column.

For each school, the third grade results are given on the left page and sixth grade results on the right page, followed by the predictor values* for each school. The school number is repeated in the column on the far right to facilitate identification of schools.

Average scores for the district* are listed at the end of the school scores.

APPENDIX A

DEFINITION OF MAJOR TERMS

The major terms related to the development of 1975-76 predicted scores are discussed below.

Predictor Variables

The predictor variables used in calculating the 1975-76 scores were collected on a school basis. They are expressed as percentages for the school. The district averages listed on the tables are weighted averages based on the population of each school. The definition and source of each variable are listed below.

1. Spanish Native Language. As part of the demographic information collected on students who participated in the 1975-76 assessment, all students were classified according to their native language. The percentage of students whose native language is Spanish is given by grade.

2. Family Income. Family income is the principal's estimate of the approximate percentage of the student body on the free or reduced lunch program, collected through the 1975-76 Quantitative Data Report (ACC-1) completed by each principal.

3. White Collar Occupation. The white collar occupation figure is the principal's estimate of the approximate percentage of the student body where the chief "bread winner" of the family is employed in a "white collar" occupation. This was collected through the 1975-76 Quantitative Data Report (ACC-1) completed by each principal. "White collar" occupations include professional, technical, and kindred workers; managers, officials, and proprietors (excluding farm); clerical and kindred workers; and sales workers.

4. College Education. The college education figure is the principal's estimate of the percentage of students from families where either parent had at least some college education. It was collected through a 1975-76 survey distributed by the Statewide Assessment Program.

5. Minority Enrollment. The minority enrollment figure is the percentage of minority students in the school. It was collected through the 1975-76 Civil Rights Survey. Minority students are defined as all those except white or Spanish.

Observed Scores

For each school, there are results for mathematics, communication skills (reading and writing), and total test. In each case, the school test score, also referred to as the observed score, is based on the average number of test items answered correctly. This average was converted to a normal distribution in which the state score is 50 and the standard deviation is 10.

The purpose of the transformation is to aid interpretation of scores for the various subjects and grades since different numbers of items were used for each, as shown below.

Number of Items Per Subject

Grade	Comm. Skills	Math.	Total Test
3	102	71	173
6	118	107	225

Without the transformation, a score of 57 in third grade mathematics could not be compared to a score of 61 in reading because they would represent 57 of 71 items versus 61 out of 102 items.

School Predicted Range

The predicted range for each school is given as a minimum and maximum score, such as 41-64. This range is based on a confidence level of .05, which means that there is a 95% probability that the school's true predicted score is within the range.

District Scores

The district observed scores, predicted ranges, and predictor variables are weighted averages of the scores for all schools in the district. Separate multiple regression calculations were not used to produce district predictions.

Outlier

A school whose observed score is either above or below its predicted range is considered to be an outlier. If the school's test score is higher than the predicted maximum, the school is considered a positive outlier (marked with a "+" in the tables). If the school's test score is lower than the predicted minimum, the school is considered a negative outlier (marked with a "-" in the tables).
